

ABSTRACT OF THE DISCLOSURE

A transaction mediation system and a printing mediation system is provided that enables products of high quality (printed matter) even in the case that the ordering quantity of the products (printed matter) is small. In case that the printed matter is ordered by the printing mediation center from the printing supplier and by the shop from the printing mediation center, the transaction is subjected to the first transaction price table and the second transaction price table respectively. In case that there exists at least plurality of shops that complies with the second transaction price table and that there is a relationship in which the price per unit quantity of the product in accordance with said first transaction price table is equal to or less than the price per unit quantity of the product in accordance with said second transaction price table, the printing mediation center mediates the order of the printed matter from the printing service of the shop.
